

A host of online
network solutions...

The VoiceHost Network:

Designed and implemented for powerful low-latency connectivity, VoiceHost provides an ideal environment for VoIP Telecommunications utilising the Session Initiation Protocol (SIP). The VoiceHost network offers complete quality of service (QoS) for voice applications with access from all major UK networks and service providers. Direct connections and membership into both LINX and LONAP, the largest IXPs in the UK (**LINX is the 3rd largest IXP in the world**); means we're operating inside a network of interconnected switches at major data centres in London. This provides VoiceHost with a professionally run, uncongested peering and transit fabric.
